

ZOKKU Hub guide

One small app that installs, updates and removes the eleven plugins. Optional: the plugins never need it to run.

The list

Every plugin on one row, with the version you have and the latest one, and a chip with its state: *Update*, *Installed*, *Trial · days left*, *Trial ended*, *Owned*, *Not installed*, *Working*.... Filters show only what needs you. Switch to **Library** and every plugin is a tile that plays a short, silent capture of its interface.

Install and formats

Pick a plugin, choose the formats (VST3, CLAP, and AU on a Mac) and see the size of each before anything starts. On Windows one permission prompt covers the whole job; on a Mac, one password. Every package is checked against its size and SHA-256 before it touches your plugin folders. Close your DAW first.

The screenshot displays the Zokku Hub interface. On the left, a 'library' sidebar shows 8/11 installed plugins. The main area features a detailed view of the 'kitto' plugin, which is currently 'Not installed'. The plugin details include its version (0.7.4), size (29.0 MB), and download status. Below this, the 'INTERFACE' section shows a preview of the plugin's controls, including a grid of drum samples (KICK, SNARE, LOW TOM, MID TOM, etc.) and a waveform display for the 'kick' sample. The bottom status bar indicates 'Ready. The Hub installs nothing until you click.' and 'No background service · nothing starts at login'.

Update all

Update all says how many plugins and how many megabytes before you press it. The update catalogue is signed and checked before the Hub reads it. Offline, the Hub shows the last catalogue it checked, and when; nothing retries on its own. **Check now** reads it again.

The screenshot displays the Zokku Hub interface. On the left, a 'library' sidebar shows 8/11 installed plugins: tammo (0.14.2 → 0.14.6), vela (0.8.4), ikipump (0.12.0 → 0.12.4), fuzzo (0.7.4), ascent (0.9.5), kizami (0.8.4), kitto (0.7.4), tatakitt (0.6.0 → 0.6.4), and utsuri (0.6.7). The 'ascent' plugin is highlighted, showing it is installed and has a 15.0 MB disk size. The main panel shows the 'ascent' plugin details, including its formats (VST3, CLAP, AU), license status (Licensed on this computer), and a message about a build update: 'ascent 0.9.5, checked against its candidate build: ASCENT.clap did not match. Replaced from the package (a copy of the old files was kept); every file now matches.' Below this, the 'INTERFACE' section shows a live capture of the plugin's settings, including a waveform display, a peak meter, and various control knobs and buttons.

Account, trial and activation

Everything works without an account. **Start free trial** on a plugin starts the 7-day trial on this computer; **Sign in** (top right) shows what you own as *Owned* and activates it as it installs; turn that off in the account sheet if you prefer. **Activate online** opens your browser to sign in; **Activate offline** saves a request file for a computer without internet. **Deactivate** frees the seat. Sign out and the licences stay on the computer; the Hub never keeps your password.

ascend 0.9.5, checked against its candidate build: ASCENT.clap did not match. Replaced from the package (a copy of the old files was kept); every file now matches.

No background service · nothing starts at login

Quiet by design

No background service: nothing starts at login and nothing runs when the Hub is closed. No telemetry: without an account the Hub only downloads the catalogue and the packages, with no identifiers. Removing the Hub leaves the plugins installed.

Remove a plugin or the Hub

In the Hub, **Uninstall** on a plugin keeps a copy so you can restore it (on a Mac the plugin is moved to a ZOKKU folder, never deleted). To remove the Hub on Windows: **Settings, Apps, Installed apps, ZOKKU Hub, Uninstall**.
